DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) do not apply to the examination of this application as the application being examined was not (1) filed on or after November 29, 2000, or (2) voluntarily published under 35 U.S.C. 122(b). Therefore, this application is examined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

2. Claims 1-25 are rejected under 35 U.S.C. 102(e) as being anticipated by Willenegger et al. (U.S. Patent 5,933,781).

Willenegger et al. disclose an apparatus and method for adjusting transmission power in a CDMA terminal, comprising:

a plurality of spreading means (16, 70, 72) disposed for spreading data for each code channel;

a plurality of first variable gain control means (16, 70, 72) disposed for each code channel for adjusting levels of output signals from the spreading means (see col. 3, lines 42-56);

adders (20);

modulators (26); and

second variable gain control means (30) for adjusting a level of the high frequency signal (see col. 3, lines 64-66).

Willenegger et al. further provide for a transmitter (30), control means (60), level setting circuit (60) in a mobile station in communication with a base station. See cols. 3-5.

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Rich (U.S. Patent 5,862,460) provides for two stage variable gain adjustments.

Nomura (U.S. Patent 6,272,125) provides for variable gain control of a transmission output signal.
